There are a number of configuration-related files which you may need in your application. Here we provide samples.

- **Platform:** All
- **Language:** N/A
- **Download:** [Silverlight-related files](#), [IIS-related files](#), [Sample N-Tier config files](#)

Problem

You'll occasionally need to customize the configuration of your application. For example, you may need a *ServiceReferences.ClientConfig* in your Silverlight application to customize the communication settings. Or you need to customize the *web.config* but need a template to help.

Solution

We offer sample files for a number of common configuration-related tasks.

Silverlight-related files

- ServiceReferences.ClientConfig and app.config.
- Sample clientaccesspolicy.xml. Note this sample provides "wide-open" access and is not recommended in production. Use it as a template for your customizations for cross domain access.
- Sample *TraceWindow* user control.

IIS-related files

- Sample web.config with all possible service definitions.
- Sample [global.asax](#)
- Sample *.svc files, including a sample showing the *EntityServer* with a data source extension.

Miscellaneous n-tier config files

- Various client and server n-tier config files are provided to show different communication configurations.
