Every property on a DevForce entity has a [GetterInterceptor](#) and a [SetterInterceptor](#). These interceptors can be used to add or remove the actions associated with that property. Under the covers this is going through the [PropertyInterceptorManager](#) mechanism, but the syntax is often simpler.

For example, here's a "before get" action added to the Employee.Title property getter:

```
Employee.PropertyMetadata.Title.GetterInterceptor.AddAction(  
    IbCore.PropertyInterceptorTiming.Before,  
    args => args.Value = args.Value.ToUpper());
```

```
Employee.PropertyMetadata.Title.GetterInterceptor.AddAction( _  
    IbCore.PropertyInterceptorTiming.Before, Function(args) _  
    args.Value = args.Value.ToUpper())
```
